

# Strategic Portfolio Execution for Energy & CNI

Connect strategic outcomes to programme delivery — inside Azure DevOps.

## ■ Project Online retires 30 September 2026

Microsoft is shutting down Project Online with no extension. Organisations using POL for portfolio management must migrate before the deadline. OutcomeMap connects to your existing Azure DevOps environment — no data migration, no new platform, no 6-month implementation project.

## Built for Energy Sector Programme Delivery

### Clean Power 2030 Alignment

Map strategic outcomes directly to Clean Power 2030 milestones. Track delivery progress against DESNZ commitments in real time.

### SSEP & CSNP Tracking

Connect Strategic Spatial Energy Plan and Centralised Strategic Network Plan workstreams to delivery teams and report portfolio health to Ofgem.

### UK Data Sovereignty

Hosted on Microsoft Azure UK (South/West). No data leaves the UK. CNI-compliant architecture with no third-party platform dependencies.

### Regulatory Reporting

Executive dashboards and portfolio health strips designed for reporting to DESNZ, Ofgem, and HM Treasury — updated automatically from delivery data.

### G-Cloud Eligible

Procurement-ready for UK public sector. Enterprise tier includes SSO/SAML, SLA, and dedicated onboarding. No lengthy procurement process required.

### No New Vendor Risk

OutcomeMap runs inside Azure DevOps — your teams already use it. No new security review, no new data processing agreement, no new attack surface.

## Platform Capabilities

### Outcome-driven roadmaps

Connect delivery to strategic objectives

### Gantt timelines with milestones

Milestones pinned to interactive roadmaps

### Dependency management

Within-plan and cross-plan dependencies

### Portfolio dashboard

Health strips, cascade risk, RAG status

### Azure DevOps integration

Real-time sync with existing work items

### Executive reporting

Auto-generated, always current

## Why OutcomeMap

### Time

Competitors need 6–12 months to implement. OutcomeMap connects to your existing Azure DevOps in days. With POL retiring in under 6 months, time is the constraint that matters most.

### Risk

Every alternative requires a new platform, new security review, new data residency assessment. OutcomeMap runs inside ADO — already in your infrastructure, already approved.

### Alignment

Other tools manage tasks and schedules. OutcomeMap connects strategic outcomes to programme delivery — purpose-built for organisations reporting to government and regulators.

### Cost

No per-user licensing. Your price stays flat whether you have 100 users or 500. No implementation consultancy fees. No separate platform to procure and maintain.
